DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1, 2, 10-12, 16-17, 19, and 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Nose et al. (US 5,685,944) in view of Mendelovich et al. (US 5,735,999), Inagaki et al. (US Publication 2002/0179237), and Akemi et al. (US 5,505,306). Nose et al. discloses a transfer tool comprising a housing (Figure 2, casing C, case members C1 and C2) having an interior surface; and ribbon substrate (Figure 1, film transfer ribbon R) that travels inside the housing, the ribbon substrate being coated with an adhesive coating film to be transferred from the ribbon substrate (column 10, lines 23-27) onto the targeted object when the ribbon substrate is pressed onto the targeted object, wherein after film transfer, the adhesive film breaks near an end of the transferred length when the ribbon substrate is pulled away from the targeted object (Fig. 15). Nose et al. does not disclose a transfer tool wherein the interior surface of the housing is roughened at least in a region wherein the coating film on the ribbon substrate may contact the interior surface of the housing.

Mendelovich et al. discloses a transfer tool wherein the interior surface of the housing includes multiple bar projections, 66, wherein each bar projection has a line of

Art Unit: 1734

points higher than any other portions thereof in its configuration. The projections are located at least in a region wherein adhesive elements on a carrier tape may contact the interior surface of the housing (Figure 7) to prevent the adhesive tape from undesirably sticking to the interior surface of the housing (column 5, lines 1-15). It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the transfer tool of Nose et al. to include projections on the interior surface of the housing as suggested by Mendelovich et al. to prevent the coating film from adhering to the interior surface of the housing. The references as combined fail to show the multiple projections to each have one point higher than any other portions thereof.

Inagaki et al. shows that projections to limit adhesion can be cylindrical, such as those of Mendelovich et al., or spherical or conical, both of which have a single point higher than any other portion thereof. It would have been obvious to one of ordinary skill in the art at the time the invention was made to replace the cylindrical projections of the transfer tool of the references as combined with either spherical or conical projections because Inagaki et al. shows these to be interchangeable (paragraph 0011). The references as combined fail to discuss the center average height of the projections.

Akemi et al. teaches that the height of projections for preventing an adhesive film from sticking to a surface and the proportion of the surface area comprising the projections vary depending upon the composition of the adhesive (column 4, lines 30-63). Akemi et al. further teaches the preferred height of the projections to be 2 to 1000 µm. It would have been obvious to one of ordinary skill in the art at the time the invention was made to make the center average height of the projections of the

Page 4

Art Unit: 1734

references as combined greater than 9 µm because Akemi et al. teaches that this range is satisfactory for conventional adhesives. Furthermore, Akemi et al. teaches that the projection height and pitch are result effective variables dependent upon the composition of the adhesive and one of ordinary skill in the art would use routine optimization to determine the appropriate height and load length ratio.

Regarding independent claim 23, Akemi et al. teaches that the percentage of the projections is also dependent upon the composition of the adhesive. It would have been obvious to one of ordinary skill in the art at the time the invention was made to make the ratio of a pitch to a height of the projections equal to or lower than 22.0 because Akemi et al. teaches that the projection height and pitch are result effective variables dependent upon the composition of the adhesive and one of ordinary skill in the art would use routine optimization to determine the appropriate ratio.

As to claim 2, the references as combined (see Nose et al.) disclose a transfer tool wherein the ribbon substrate is a tape (see Figure 1, film transfer ribbon R).

As to claim 10, the references as combined are silent as to a transfer tool wherein the entire inner surface of the housing has a roughened surface. When modifying the transfer tool of Nose et al. as noted above to include roughening the interior surface of the housing to prevent the coating film from adhering to the interior surface of the housing, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the housing of Nose et al. to include projections on its entire inner surface to minimize the possibility of having the coating film undesirably adhere to any portion of the housing's interior.

Art Unit: 1734

As to claim 11, the references as combined (see Mendelovich et al.) disclose a transfer tool wherein the housing has projections along a path where the ribbon substrate (Figure 7, carrier tape 98) travels inside the housing.

As to claim 12, the references as combined (see Mendelovich et al.) disclose a transfer tool further comprising a dispenser at which the coating film is dispensed from the ribbon substrate, wherein the projections provided on an upstream side of the dispenser.

As to claim 16, the references as combined (see Mendelovich et al.) disclose a transfer tool wherein the projections are formed in a repetition of a predetermined pattern (Figure 7). In any event, it would have been readily apparent to one of ordinary skill in the art at the time of the invention to select the shape of the projections to form a variety of patterns as an aesthetic design choice.

As to claim 17, the references as combined (see Nose et al.) disclose a transfer tool wherein the coating film is a correction film (column 21, lines 53-54).

As to claim 19, the references as combined (see Nose et al.) disclose a transfer tool wherein the ribbon substrate is formed mainly of polyethylene (column 14, lines 30-32) and has a thickness of about 25 μ m (column 10, lines 23-24).

As to claim 22, the references as combined (see Nose et al.) disclose a transfer tool wherein the coating film is about 20 μ m in thickness (column 10, lines 25-26).

3. Claim 3 is rejected under 35 U.S.C. 103(a) as being unpatentable over Nose et al. (US 5,685,944) in view of Mendelovich et al. (US 5,735,999), Inagaki et al., and

Art Unit: 1734

Akemi et al. as applied to claim 1 above, and further in view of the admitted prior art and Daouse et al. The references as combined do not disclose a transfer tool wherein at least the roughened surface of the housing contains a non-stick material. The admitted prior art discloses a transfer tool wherein a surface of the housing contains a non-stick material (page 2 of the specification, paragraph 8). When modifying the inner surfaces of the housing as noted above to be resistant to the undesired adhesion of the coating film, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the roughened surface of the housing of the references as combined to contain a non-stick material as suggested by the admitted prior art to provide the interior surface of the housing with additional resistance to the undesired adhesion of the coating film.

Daouse et al. teaches that an effective plastic material for non-stick objects is polyethylene (column 4, lines 52-55). It would have been obvious to one of ordinary skill in the art at the time the invention was made to make the housing of the references as combined of polyethylene because Daouse et al. teaches this to be a well known non-stick material.

Claims 14-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over 4. Nose et al. (US 5,685,944) in view of Mendelovich et al. (US 5,735,999), Inagaki et al., and Akemi et al. as applied to claim 1 above, and further in view of Kamata (US 5,431,697). The references as combined show a transfer tool made mainly of polyethylene. Kamata et al. teaches that a color changing injection molded article of

Application/Control Number: 10/792,343

Art Unit: 1734

either polyethylene or polypropylene (column 3, lines 11-17) should include a metal salt of stearic acid as a dispersant (column 7, lines 3-8). Kamata et al. further teaches an effective dispersant to be a combination of magnesium stearate and zinc stearate in a total amount of approximately 0.4% of material weight (column 9, lines 35-42). It would have been obvious to one of ordinary skill in the art at the time the invention was made to add magnesium stearate and zinc stearate into the injection molding composition of the references as combined above because Kamata et al. teaches that these materials are important as a dispersant when adding a material such as a colorant.

Page 7

5. Claim 20 is rejected under 35 U.S.C. 103(a) as being unpatentable over Nose et al. (US 5,685,944) in view of Mendelovich et al. (US 5,735,999), Inagaki et al., and Akemi et al. as applied to claim 1 above, and further in view of Van Hoof et al. (US 3,936,571). The references as combined do not disclose a transfer tool wherein the ribbon substrate is processed for both surfaces to exhibit releasability. It is well known and conventional in the tape dispenser art, as disclosed by Van Hoof et al. (column 3, lines 41-48), to coat one or both sides of a liner carrying an adhesive tape with an antiadhesion agent to prevent adjacent convolutions of the adhesive tape roll from bonding together, as well as for handling adhesive tapes which have an adhesive layer on both sides. It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the ribbon substrate of the references as combined to have both surfaces coated with an anti-adhesion agent as suggested by Van Hoof et al.; coating

Application/Control Number: 10/792,343

Art Unit: 1734

both sides of a release liner being well established in the art for preventing adjacent convolutions of an adhesive tape roll from bonding together.

Page 8

6. Claim 21 is rejected under 35 U.S.C. 103(a) as being unpatentable over Nose et al. (US 5,685,944) in view of Mendelovich et al. (US 5,735,999), Inagaki et al., and Akemi et al. as applied to claim 1 above, and further in view of Yamashita (US 2004/0180196). The references as combined are silent as to the composition of the coating film. Yamashita discloses a transfer tape comprising an emulsion-type acrylic adhesive, a rosin-type tackifier, a phthalocyanine blue colorant, crawling inhibitor, and water, which maintains strong adhesive strength but can be reliably cut at a stipulated position (abstract; page 3, paragraphs 36-42). It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the coating film of the references as combined to include an emulsion-type acrylic adhesive, a rosin-type tackifier, a phthalocyanine blue colorant, crawling inhibitor, and water as suggested by Yamashita to provide a transfer tape which maintains strong adhesive strength but can be reliably cut at a stipulated position.

Response to Arguments

7. Applicant's arguments, see Page 5, Paragraph 3, filed June 27, 2007, with respect to the rejection(s) of claim(s) 1-2, 10-12, 16-17, 19 and 22 under 35 U.S.C. 103(a) have been fully considered and are persuasive. Therefore, the rejection has

Application/Control Number: 10/792,343

Art Unit: 1734

been withdrawn. However, upon further consideration, a new ground(s) of rejection is

Page 9

made in view of the previous prior art in combination with Inagaki et al.

Conclusion

8. Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Mark A. Osele whose telephone number is 571-272-

1235. The examiner can normally be reached on M-F 9:30-6:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Philip Tucker can be reached on 571-272-1095. The fax phone number for

the organization where this application or proceeding is assigned is 571-273-8300.
